AppRL

About PortalView Dynamic Fields for JSM

PortalView enhances the JSM experience by showing selected issue fields and SLA status right in the customer portal, so your customers always see the most relevant information without needing agents to open the issue view.

Overview

PortalView is a Forge app for Jira Service Management Cloud that empowers administrators to:

- ✔ Select specific fields to display in the customer portal (like Priority, Assignee, Custom fields)
- ✔ Optionally show the SLA remaining time and status
- ✔ Configure settings per Project + Request Type
- ✔ Automatically hide the app UI when no configuration exists for a project

This improves transparency for your customers, reduces confusion, and cuts support follow-up interactions.

Key Features

✔ Customizable Field Display

Choose up to 4 fields from each request type that will appear on the customer portal.
Fields are rendered with clean formatting including text, arrays, and custom objects.

✔ SLA Insight Included

Optionally display the SLA remaining time, status, and progress bar for the selected SLA of each request.
Portal visitors get real-time SLA information without switching views.

✔ **Project & Request Type Granularity**

Admins can define different field and SLA displays for each JSM project *and each request type* — making configurations flexible.

✔ **Automatic Hiding When No Configured**

If a project or request type isn't configured, the app hides itself and does not render unnecessary UI on the portal.

✔ **Respectful of Permissions**

Built with Forge and Atlassian security best practices — only visible to customers on the portal with proper permissions.

How It Works

1. **Install PortalView** from the Atlassian Marketplace.
2. Go to *App Configuration* in Jira (Apps → PortalView).
3. Select the **Project** and **Request Type** you want to configure.
4. Pick up to 4 fields from your catalog to display.
5. If desired, toggle SLA visibility and provide the SLA identifier or name.
6. Save — and customers on the portal will immediately see the selected fields and SLA info.

Use Cases

For Support Teams

- Show key issue metadata (Assignee, Priority, Category) upfront
- Surface SLA countdown and status to customers in the portal

For Customers

- See critical information without navigating into the full issue
- Understand SLA expectations immediately

Benefits

- Reduce ***"What's my SLA?"*** tickets
- Create informative portals without custom coding

- Streamline customer communication
- Improve support experience and transparency
