How to Configure PortalView – Dynamic Fields for JSM

This section explains how administrators can configure which fields are displayed to customers in the Jira Service Management portal.

Who can configure this app?

Only **Jira administrators** (or users with project administration permissions) can access and configure this screen.

End users and customers **cannot** modify these settings, they will only see the result of the configuration inside the portal.

For security and compliance reasons, only the Customer can see what has been configured in the portal.

1 - Select a Project

Choose the Jira Service Management project where the configuration will apply.

> The configuration is scoped per project, allowing different setups for different service desks.

2 - Select a Request Type

After selecting a project, choose the **Request Type** you want to configure.

Each request type can have its own independent configuration.

3 - Choose Fields to Display (up to 4)

You can select **up to 4 fields** to be displayed in the customer portal.

Supported fields include:

- System fields (e.g., Priority, Assignee)
- Custom fields
- Asset / Object fields (Assets / CMDB)
- Text, select, and reference fields

Once selected, these fields will appear in the portal view of the request.

> ⚠️ Only the selected fields will be visible to customers.

4 - (Optional) Enable SLA Display

If you want to show SLA information in the portal:

1. Enable **“Show SLA in portal”**
2. Enter the **SLA ID**
3. Click **Validate SLA**

The app will validate the SLA against the current issue to ensure it exists and is accessible.

When enabled, customers will see:

- SLA status (Running / Paused / Breached / Completed)
- Remaining time
- Progress bar

5 - Save Configuration

Click **Save configuration** to apply the settings.

The configuration is immediately active for:

- All customers accessing the portal
- All issues of the selected request type
